The Arabic letters are displayed right-to-left, and in addition, Arabic letters are cursively joined. *Simplified* Unicode bidi algorithm for SMS/CBS: Bidi AL must be handled as bidi R, except Arabic punctuation which is handled as ON; all bidi EN and AN handled as L; all ET, ES, CS handled as ON, and 'paragraph direction' is always LTR, there are no bidi controls that span a text range. Bidi mirroring is done *only* by using the data in BidiMirroring.txt. Use a Nastaʿlīq style font for the display of the Arabic characters here.

LF: LINE FEED; moves to the next line (with implied carriage return).

CR: CARRIAGE RETURN; CR is not used as CR but is used as a filler after the actual SMS/CBS message text. CR should not occur inside a message text, but if it does, it must be converted to LF. Note though that <SS2,CR> is actually CSI (se next table), and that "CR" is not a filler, nor LF.

SS2:   SINGLE SHIFT TWO; This code shifts the next 7-bit code unit to refer to an extension of this table (subclause A.4.13.2). (Note: setting, in the SMS and CBS protocols, base or extension table with reference value 0x10 or larger automatically sets the other tables with the same reference value.) When splitting a message text into submessages, there must be no cut right after an SS2.

ZWNJ: Use MIDDLE DOT (U+00B7, 0x1B3F) (visible) to get non-join shape(s) instead of ZWNJ (invisible).

ZWJ: Use ARABIC TATWEEL (U+0640, 0x7C) (visible) to get a join shape instead of ZWJ (invisible).

LRM,RLM: These should only be used to get the correct 'bidi directionality' of initially 'bidi neutral' symbols in case of *bidi directional change* around the symbol, to get the correct (readable!) display order. While zero-width, these should have visible glyphs; like a narrow bar with a 'flag' indicating direction.

In the event that an MS receives a code where a symbol is not represented in the above table then the MS shall display the REPLACEMENT CHARACTER (U+FFFD).

FF: FORM FEED; This code is defined as a Page Break character (with implied carriage return). Any mobile station which does not have pagination shall treat is as a LF (with implied carriage return).

CSI: CONTROL SEQUENCE INTRODUCER; enables decimal character references, enables styling. An MS which does not support CSI shall convert it to REPLACEMENT CHARACTER.

SS3: SINGLE SHIFT THREE; This code is reserved for the extension to another extension table. When splitting a message text into submessages, there must be no cut right after an SS3.

U+2044 FRACTION SLASH; the sequence may need to be isolated from adjacent digits by '+' sign(s)..
